## Per-instance Comparison with Published IJSP Solvers on All 70 Taillard Instances

Companion to: “Neighbourhood Structures and Ranking Operators  
for the Interval Job Shop Scheduling Problem”

Hernán Díaz

### Description

This document reports per-instance RE (%) and median runtime for all 70 Taillard Interval Job Shop Scheduling Problem (IJSP) instances, comparing four solvers: *fEABC* [1], *ESABC* [2], *TS-N<sub>2</sub>* (this work), and *TS-N<sub>8</sub>* (this work).

**Metric.**  $RE(\%) = (E[C_{\max}] - LB) / LB \times 100$ , where LB is the published lower bound of the *crisp* (deterministic) counterpart of each Taillard instance [3]. The interval IJSP and the crisp JSP are structurally distinct optimisation problems, so these crisp lower bounds are used here only as a common, hardware-independent reference yardstick; they are *indicative* for the interval setting and do not constitute a strict optimality gap.

**Columns.** For each solver: *Best* = best RE (%) over 30 runs; *Avg* = mean RE (%) over 30 runs (bold = row minimum); *t* = median runtime in seconds (TS) or average runtime in seconds (ABC methods).

**Instances.** The 70 Taillard IJSP instances (TA1–TA70) are derived from the classical Taillard JSP benchmarks [3] by applying a  $\pm 7.5\%$  symmetric interval perturbation to each nominal processing time:  $p_{ij} = [0.925 p_{ij}^*, 1.075 p_{ij}^*]$ . Seven size classes are covered:  $15 \times 15$  (TA1–10),  $20 \times 15$  (TA11–20),  $20 \times 20$  (TA21–30),  $30 \times 15$  (TA31–40),  $30 \times 20$  (TA41–50),  $50 \times 15$  (TA51–60),  $50 \times 20$  (TA61–70).

**TS configuration.** Irace-tuned tabu search (Phase B of the main paper), 30 independent runs per instance, 15-minute wall-clock time limit per run, on an Intel Xeon E5-2680 v4 at 2.40 GHz (WSL2 Linux).

**Irace training instances.** The irace tuning of Phase B (Section 8.1 of the main paper) used a stratified random subset of 20 of the 82 benchmark instances ( $\approx 24\%$ ), drawn uniformly at random within each size stratum. The 62 instances *not* included in the list below were held out from tuning and contribute the unbiased evaluation reported in the main paper and in Tables 1–2.

- *Classical* (3 of 12): **ft10**, **abz7**, **la27**.
- *Taillard*  $15 \times 15$  (2 of 10): TA3, TA8.
- *Taillard*  $20 \times 15$  (2 of 10): TA12, TA17.
- *Taillard*  $20 \times 20$  (3 of 10): TA21, TA24, TA29.
- *Taillard*  $30 \times 15$  (2 of 10): TA32, TA36.
- *Taillard*  $30 \times 20$  (3 of 10): TA43, TA47, TA50.
- *Taillard*  $50 \times 15$  (2 of 10): TA52, TA57.
- *Taillard*  $50 \times 20$  (3 of 10): TA63, TA67, TA70.

The full irace input files (`instances.txt`, `parameters.txt`, `scenario.txt`) and the resulting `iracedump.rda` files for each of the five neighbourhoods are archived at [4].

Table 1: Taillard IJSP instances, Part I (TA1–TA40).  $RE(\%) = (E[C_{\max}] - LB) / LB \times 100$ . All methods: 30 runs. Bold: row-minimum average RE.  $t$  = median runtime (s) for TS; average for ABC methods.

| Size           | Inst. | LB   | <i>fEABC</i> [1] |             |      | <i>ESABC</i> [2] |       |      | <i>TS-N<sub>2</sub></i> (ours) |             |     | <i>TS-N<sub>8</sub></i> (ours) |             |     |
|----------------|-------|------|------------------|-------------|------|------------------|-------|------|--------------------------------|-------------|-----|--------------------------------|-------------|-----|
